

Welcome

The CanMEDS 2000 Project outlines skills required by Residents in the new millennium. As Scholar, upon completion of a specialty program, Residents should be able to pose a research question, develop a proposal, plan a methodological approach, carry out the project, and defend and disseminate the results.

Source: The Royal College of Physicians and Surgeons of Canada's Canadian Medical Education Directions for Specialists 2000 Project (September 1996).

This program will expose Residents to a basic level of research training as required by the Royal College. It is assumed that participants have no previous background in the areas covered. You will be introduced to study design, literature search strategies, basic biostatistics, critical appraisal, the publication process and effective presentation skills.

In the past, Residents have found this program a unique opportunity to interact with colleagues from across the country, while developing critical appraisal and research skills. Junior Residents just starting a research project and graduating Residents wanting a review for the Royal College Exams should all benefit.

We hope you have an enjoyable and rewarding time.
